

CESARINI SFORZA

Installation of new glass line for high quality sparkling wine

CUSTOMER NEED:

The installation of a complete glass line and the supply of a set of unifilar tapes, as well as an operation of PLC software integration and operator panel, including data exchange between the line and the plant management system

BBM SOLUTION:

After a first technical audit at the headquarters, where the production needs and technical details were discussed, BBM began dialogues with the customer's suppliers for the installation of the new glass bottling line for classic method sparkling wine. In July 2021, after receiving the necessary equipment, BBM specialized technicians proceeded with the installation and commissioning with testing of the new degorgement line, a technique used in the production of sparkling wines, with the aim of making the wine perfectly clear. BBM took care of physically connecting all the new machines in the line thanks to the new electrical automation panel.

The result is an updated and cutting-edge production line, capable of guaranteeing a performance of 3000 bottles per hour.
