

# Relocation of glass line and supply of PET line

Relocation of glass line, supply and installation of PET bottling line for Fonti di Posina

## CUSTOMER NEED:

In 2023, to meet new production and market needs, Fonti di Posina engages in a total renewal of its plant. The goal? Create a high-performance and sustainable bottling plant

## BBM SOLUTION:

The first phase of the project saw the conservative relocation of a part of the glass bottling line, with the aim of differentiating and separating the packaging of the bottles into crates and cartons. In just three weeks, the dismantling, relocation, assembly, and start-up of the glass line was completed. The result is a 20-30% more efficient line, capable of producing 10,000 bottles per hour in four formats.

Space was created for the installation of a new PET bottling line. BBM supplied a Sidel Universal 2 Combi – complete with blow moulding machine and filling monoblock – an ACMI packaging machine and a handle machine. The used machinery has been completely overhauled; overhaul operations also included thread conversion to Gravity 2.

**A special handle machine.** The handle installed by BBM Service works with a pre-thermo mechanism; entirely designed by BBM Service, the device applies handle before the film is wrapped on the bundle. The result is a handle machine that is fully integrated into the packaging machine.
