

Supply and installation of a used bottling line in record time

Supply and installation of a line in record time for Acqua S. Maria at Capannelle

CUSTOMER NEED:

A complete and automatic PET bottling line, with a nominal production rate of 16,000 bottles per hour in 1500 ml and 500 ml formats

BBM SOLUTION:

The project entrusted to BBM included the dismantling of existing lines, clearing the warehouse with waste disposal, and retrieval of machinery still in good condition. BBM Service's technical office worked on designing a new layout to ensure optimized line efficiency with reduced production times and waste, as well as an improvement in safety for on-site operators. Subsequently, BBM oversaw the supply of machinery for the new line, already overhauled and adapted to the customer's needs. BBM also managed the transportation of the machinery to the Acqua Capannelle facility. Here, they handled the assembly and commissioning of the line, providing specialized training for the operators. From an entirely empty warehouse to the finished line, the installation took about two months and involved the efforts of 8 BBM technicians. The result? A cutting-edge automated line capable of producing 16,000 bottles per hour in two distinct formats. This success was made possible through the valuable collaboration of the Acqua Capannelle team.
